I create accurate, publication-ready scientific illustrations for taxonomic and morphological studies. Based on microscope photographs, camera lucida sketches, or SEM and DIC images, I produce clear, standardized line drawings that emphasize **diagnostic morphological characters and comply with the editorial and reviewer expectations of scientific journals**.

My work goes beyond simple redrawing. Each illustration involves **scientific interpretation of morphological structures**, including correction of proportions, standardization of line work, and visual clarification of characters critical for species descriptions and comparative taxonomic studies.

## Before / After Illustration Examples

- Transformation of raw sketches or photographs into publication-ready scientific illustrations
- Improved line clarity, proportional accuracy, and morphological consistency
- Clear emphasis on taxonomically informative and diagnostic features

## Typical Workflow

Raw material → Draft → Revision → Final illustration

(Final illustrations are delivered in **TIFF / JPEG/ JPG / PDF / SVG** formats, according to journal specifications.)

## Use Cases

Species descriptions · Taxonomic revisions · Scientific journal articles · MSc and PhD theses · Identification guides

## Additional Note

All illustrations are prepared with the aim of facilitating peer review, improving the clarity of morphological data, and supporting effective scientific communication in taxonomic publications.
